## 1 Introduction

### 1.1 Purpose of the document

This document describes the detailed design of the ISDAT 1.0 software. An example of an project specific architectural design is given in [Ref. 4]. A general introduction to the ISDAT is given in [Ref. 3]. An overview of documents related to coding and general guidelines are given in [Ref. 7]. The instrument specific software modules are described in separate documents. The general design of instrument modules is described in [Ref. 8]. The Freja F4 instrument detailed design is described in [Ref. 6].

### 1.2 Scope of the software

The scope of the ISDAT software is to provide a general tool for scientific data analysis of space science projects.

### 1.3 Definitions and acronyms

| Acronym | Meaning                                |
|---------|--|
| DBH     | Data Base Handler                      |
| ISDAT   | Interactive Science Data Analysis Tool |
| N/A     | Not Applicable                         |
| TBW     | To Be Written                          |

### 1.4 Overview of the document

Section 1 and 2 contain the general background. The specific software descriptions is given in section 3. Section 3 is organised after the software components and is primarily intended to be a support for the maintenance of the software.

---

## 2 Standards

### 2.1 Design Standards

The design standards and assumptions are discussed in [Ref. 3] and [Ref. 7].

### 2.2 Documentation Standards

The ISDAT documentation follows the ESA standards [Ref. 1] in a loose manner.

### 2.3 Naming Conventions

The naming conventions follows the recommendations given in [Ref. 7].

### 2.4 Programming Standards

The ISDAT core software is written in C, and follows the standards described in the ISDAT general guidelines [Ref. 7].

### 2.5 Software Development Tools

The basic development platform is a SUN Sparc station II.

## 3 System Design Specifications

### 3.1 ISDAT Directory Tree

Each sub-directory containing source code should include an Imakefile as well as a Makefile with reference to the next level in order to facilitate the possibility to automatically build the complete ISDAT from the ISDAT root level. The ISDAT directory tree consist of the following main branches:

**Db** All source code related to the DBH, including source code for the DbLib (see [Ref. 5]). The components are described in section4.

**bin** TBW

**config** Configuration files for all supported platforms. The components are described in section 5.

**doc** All on-line manual pages source code. See [Ref. 5, 11].

**include** All system level include files. See Appendix A.

**crpe** IDL interface library. See [Ref. 10].

**eiscat** EISCAT instrument specific source code. Not included in the public distribution.

**filter** Filter source code. See [Ref. 9].

**fmi** Source code related to the TS scientific library. See [Ref. 11].

**matlab** Source code related to the MatLab interface. See [Ref. 2].

**motif** Motif related source code.

**sci** Scientific analysis and display client software.

**sys** TBW

**tech** Source code for clients used for system development.

**tools** TBW

**util** TBW

**xgks** Source code related to XGKS.

---

## 4 Directory Db Component Specifications

### 4.1 Sub-directory lib

Directory lib accommodates all source code for the DbLib [Ref. 5].

### 4.2 Sub-directory server

Directory server should accommodate all instrument specific source code. The content may vary from one installation to another.

### 4.3 Sub-directory include

Directory *include* accommodates all instrument specific include files.

---

## 5 config Component Specifications

TBW

## A include files

All instrument specific include files reside in the sub-directory *instrument*. They are not included in theis appendix. The reader is referred to the relevant instrument specific detailed design documents.
